Nature's Creation® Earthworm Castings with Mycorrhizal Fungi are a high source of beneficial bacteria which increases the microbial activity and adds to the improvement of the soil structure.

Earthworm castings manure is essentially earthworm waste. As earthworms eat through compost, their waste creates an optimal soil enricher. Organic matter feeds soil microorganisms that produce, store and slowly release plant nutrition. The castings also improve soil aeration and drainage as well as increasing the water retention.

Nature's Creation® Earthworm Castings with Mycorrhizal Fungi can be applied to annuals, perennials, trees, shrubs, vegetables, roses and turfgrasses. An all-natural product that is odorless, rich in humus and organic matter which promotes strong plant growth and improves root structure and will not burn!

Why Add Mycorrhizal Fungi?

Nature's Creation® Earthworm Castings with Mycorrhizal Fungi is formulated following the most modern research on the beneficial relationship between plant roots and certain fungi. Symbiosis is the word used by scientists to describe the beneficial relationship between a fungus and the roots of a plant. The term Mycorrhizal literally means fungus root. **Nature's Creation® Earthworm Castings with Mycorrhizal Fungi** contains 11 different strains of the genera Glomus, Rhizopogon, Pisolithus and Scleroderma. They are arbuscular mycorrhizal fungi that multiply and form a symbiotic relationship with the roots of the host plant. The benefits they provide to the host plants include drought tolerance, increased water and nutrient uptake and disease resistance.
